Hello!

I'm writing about the Associate Software Engineer position supporting the Flight Safety, Security, and Regulatory/Emergency Response teams. After navigating through music business to sales to software development, I'm drawn to building systems that genuinely matter... and keeping people safe qualifies.

I taught myself JavaScript, HTML, and CSS and built projects like a calculator app and personal blog to learn clean coding and deployment practices. At Ethos Pay, I work with compliance regulations (AML, OFAC, KYC) and cross-functional problem-solving in a fintech environment, which has shown me how critical accuracy is when people's trust is on the line.

I'm currently pursuing a Software Engineering degree at WGU to expand my full stack skills. What I lack in enterprise experience, I make up for with the drive that comes from choosing to show up. Taking classes after work and after the kiddos go to bed will teach you how to learn quickly.

I'd love to discuss how my background in problem-solving and compliance-heavy environments could contribute to your team's mission.

Thank you so much for considering me!

Sincerely,
Tyler Cave
